Why is Plant Assessor So Good?

Plant Assessor was developed as a result of identifying the weaknesses of risk assessment systems in the areas of:

- *Subjectivity* – no two risk assessments are the same as they rely on the subjective judgement and knowledge of the individual assessor
- *Traditional risk assessments require extensive safety knowledge* to be thorough. This knowledge requirement includes the need to understand Australian Standards, Regulator Codes of Practice and Industry best practice.
- *The difficulty in ensuring an audit trail is in place* related to risk assessment and control, in order to illustrate an execution of the employer's duty of care to provide a safe workplace

Plant Assessor is prescriptive. Plant Assessor rates the risks and prescribes controls on a machine specific basis "real time". This takes away the need for employees to make subjective judgements about risks and the types of controls that are appropriate to manage those risks.

Staff members are consequently more comfortable in being involved in the risk assessment process. Because the process is simple and user friendly, it is a good tool to use in engaging a broader range of employees on the safety journey. Employees involved end up with better buy in to the risk assessment and control process, and safety generally.

Plant Assessor is accessible anytime, anywhere. Being web based, clients only require an internet connection and a browser – meaning no software installation, and clients are always using the latest software version and most up to date plant & equipment database.

Plant Assessor includes full corrective action management functionality. Not only does Plant Assessor tell you what to do and when to do it, it also provides you with an intuitive, interactive corrective action management system.

Plant Assessor also produces machine specific safe operating procedures and pre-operational safety checks.

Plant Assessor also supplies all safety decals in convenient format and at competitive prices.

Our catch cry is that we can make your team members plant risk assessment and control experts in half a day; all they need to do is bring their plant knowledge.
